[stabm4x] myprogram1 a successful conversion would produce user@host1$./conv1.sh: /home/user/Projects/conv1: not a directory I know that I can modify the awk code to fix the filename, but I'm still stumped as to why this is happening, and what's causing the error. A: I assume your file name may vary so you could use a function for that purpose. You may have also the problem that the input file may be empty. #!/bin/bash infile="/home/user/Projects/conv1" outfile="/home/user/Projects/conv2" func() { filename="$1" if [-f "$infile/$filename"]; then ls -l "$infile/$filename" cp "$infile/$filename" "$outfile" fi } while IFS= read -r line; do case $line in user@host2) func $line;; user@host3) func $line;; user@host4) func $line;; [^@^ 82157476af
